

Organic Matter Degrading Agent (For Fermentation and Decomposition)

SPECIFICATION

Cat.No.	EPB-051
Product Name	Organic Matter Degrading Agent (For Fermentation and Decomposition)
Application	It is used for the fermentation, decomposition and resource utilization of organic materials such as livestock and poultry manure, crop straw and biogas residue.
Product Advantage	<ol style="list-style-type: none">1. Accelerate the degradation and transformation of organic materials such as agricultural and sideline products, livestock and poultry manure, and promote the heating and decomposition process.2. Kill harmful pathogenic bacteria and insect eggs, quickly achieve harmlessness, and promote material reduction and resource utilization.3. Decompose odor molecules and reduce the generation of odor during the decomposition process, improving the production environment.4. Efficient, environmentally friendly, and no secondary pollution.
Usage Method	<ol style="list-style-type: none">1. Mix livestock and poultry manure or other fermentation raw materials and composting inoculants in a certain proportion, then compost and ferment. The compost is turned over regularly and after a certain period of fermentation and subsequent processing, it can be made into organic fertilizer. The specific fermentation operation needs to be determined according to the on-site fermentation process, material characteristics, fermentation facilities and other conditions and requirements.2. It is recommended to use 1kg of agent to ferment 1-4 tons of organic materials or waste organic matter such as poultry manure. <p>Note: This product cannot be used together with chemicals such as fungicides.</p>
